

**BHASKARACHARYA NATIONAL INSTITUTE FOR SPACE
APPLICATIONS AND GEO-INFORMATICS**

WEEKLY PROGRESS REPORT (08/01/2026 – 15/01/2026)

WEEK 2

PROJECT NAME	Monitoring and change detection system using OSINT
---------------------	---

PROJECT DESCRIPTION :

**CREATING OSINT TOOL FOR MONITORING AND
CHANGE DETECTION SYSTEM BY MONITORING
PUBLICLY AVAILABLE INFORMATION.**

GROUP MEMBER :

Harshil Vaniya, Shalomo Agarwarkar, Vrushank Thakkar

GROUP ID :

2026G195

GROUP GUIDE :

CHASIYA KRUTIKA

GROUP COORDINATOR :

SIDHDHARTH PATEL

COLLEGE GUIDE NAME :

BHUMIKA DOSHI

COLLEGE GUIDE No. :

9016888925

COLLEGE GUIDE EMAIL. :

BHUMIKASDOSHI@GMAIL.COM

COLLEGE NAME :

**DEPT. OF BIOCHEMISTRY AND FORENSICS SCIENCE, GUJARAT
UNIVERSITY**

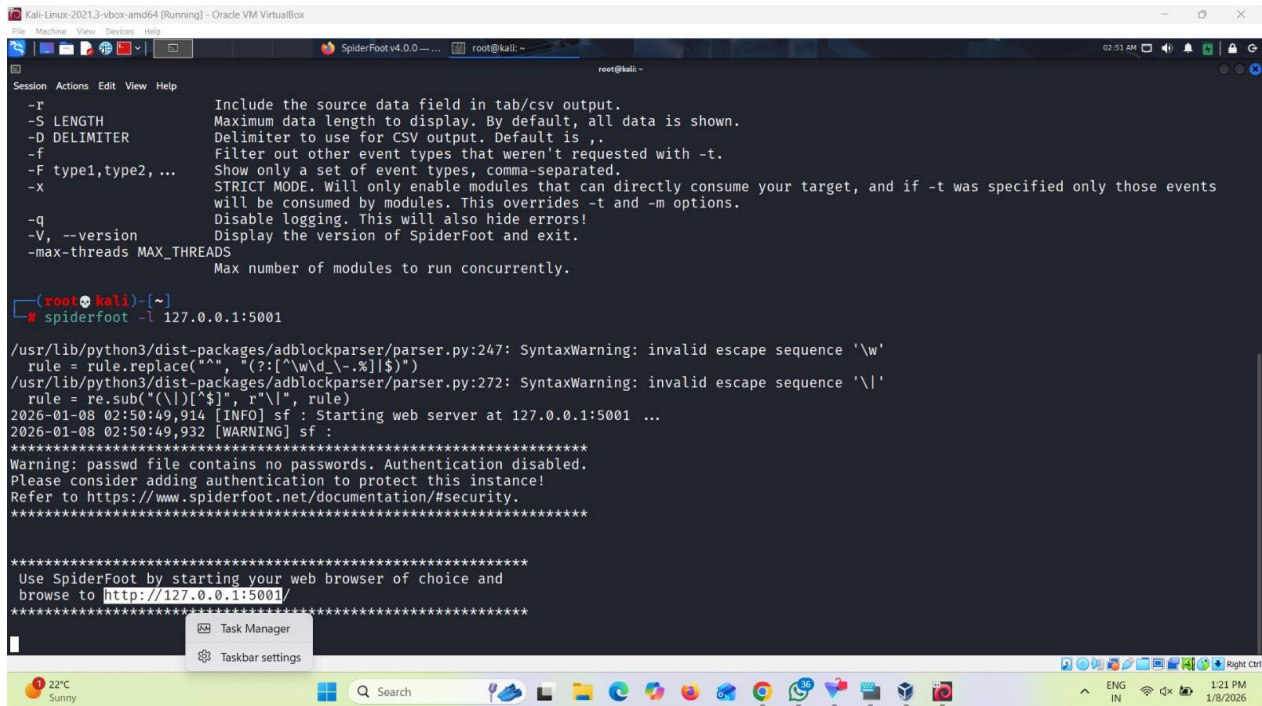

08/01/2026	• Testing web domain enumeration using tools like spider foot and sub finder(Vaniya Harshil, Vrushank Thakkar) • Kali Linux VirtualBox setup & basics of change detection engine for OSINT (Vaniya Harshil) • Public repos research(Shalomo Agarwarkar)
09/01/2026	• Form filling and amass usage and implementation (Vaniya Harshil) • Reconnaissance tool creation (Vrushank Thakkar) • Researched HIBP and alternatives& test page creation (Shalomo Agarwarkar)
10/01/2026	Holiday (2nd Saturday)
11/01/2026	Holiday (Sunday)
12/01/2026	• Reconnaissance tool error solving (Vrushank Thakkar) • Wapiti testing and researching alternatives (Vaniya Harshil) • Researching behaviour analysis and change detection techniques (Shalomo Agarwarkar) • Half day leave (Vaniya Harshil, Shalomo Agarwarkar, Vrushank Thakkar)
13/01/2026	• Researching new technologies to integrate in the tool(Vrushank Thakkar, Harshil Vaniya) • Researching cryptocurrency forensics (Shalomo Agarwarkar)
14/01/2026	Holiday (Uttarayan)

Next Week Plan	Organising everything we've learned and starting the basics of tool creation.
-----------------------	--

SpiderFoot v4.0.0 root@kali: ~
root@kali: ~
Session Actions Edit View Help
-r Include the source data field in tab/csv output.
-S LENGTH Maximum data length to display. By default, all data is shown.
-D DELIMITER Delimiter to use for CSV output. Default is ,.
-f Filter out other event types that weren't requested with -t.
-F type1,type2,... Show only a set of event types, comma-separated.
-x STRICT MODE. Will only enable modules that can directly consume your target, and if -t was specified only those events
will be consumed by modules. This overrides -t and -m options.
-q Disable logging. This will also hide errors!
-V, --version Display the version of SpiderFoot and exit.
-max-threads MAX_THREADS Max number of modules to run concurrently.

Great — this is the core intelligence layer of your project. I'll explain Change Detection Engine first, then clearly break down Hash diff, Semantic diff, and Behavior diff, with OSINT-specific examples and how they fit together.

Change Detection Engine (OSINT Context)

Children Behaviour Changes Accuracy

Accuracy

Steps added or removed

What is a Change Detection Engine?

It's a system that compares current snapshots of OSINT data with past snapshots to determine:

"Did something change — and does it matter?"

Not all changes are equal:

Ask anything

ChatGPT can make mistakes. Check important info. See [Cookie Preferences](#).

WhatBreach is an OSINT tool that simplifies the task of discovering what breaches an email address has been discovered in. WhatBreach provides a simple and effective way to search either multiple, or a single email address and discover all known breaches that this email has been seen in. From there WhatBreach is capable of downloading the database if it is publicly available, downloading the pastes the email was seen in, or searching the domain of the email for further investigation. To perform this task successfully WhatBreach takes advantage of the following websites and/or APIs:

- WhatBreach takes advantage of [haveibeenpwned.com](#)'s API. HIBP's API is no longer free and costs 3.50 USD per month. To get an API key please see [here](#)
- WhatBreach takes advantage of [dehashed.com](#) in order to discover if the database has been seen in a breach before. WhatBreach provides a link to a dehashed search for effective downloading
- WhatBreach takes advantage of [hunter.io](#)'s API (requires free API token) this allows simple and effective domain searching and will provide further information on the domain being searched along with store the discovered results in a file for later processing
- WhatBreach takes advantage of pastes from [pastebin.com](#) that have been found from HIBP. It will also provide a link to the paste that the breach was seen in and is capable of downloading the raw paste if requested
- WhatBreach takes advantage of [databases.today](#) to download the databases off the website. This allows a simple and effective way of downloading databases without having to search manually
- WhatBreach takes advantage of [weleakinfo.com](#)'s API (requires free API token) this provides an extra search for the email in order to discover even more public breaches
- WhatBreach takes advantage of [emailrep.io](#)'s simple open API to search for possible profiles associated with an email, it also dumps all information discovered into a file for further processing

Some interesting features of WhatBreach include the following:

- Ability to detect if the email is a ten minute email or not and prompt to process it or not

The Missing Link in Threat Detection: From Identification to Action

Behavioral Threat Assessment

Security intelligence professionals are confronted daily with concerning material: threats, hostile rhetoric, violent ideation. These signals emerge from numerous sources, across a wide variety of platforms including social media, forums, messaging apps, obscure websites.

An OSINT platform is indispensable for detecting threats and identifying persons of interest. It gathers digital breadcrumbs, indicators of violent intent, and reveals patterns that might otherwise remain hidden. But the crucial question remains: once a threat is identified, does your team know what to do next?

The Complexity of Modern Threat Analysis

Security teams must triage a range of potential threats. In this environment, a critical skill is different...

digital landscape open to exploitation.

In April 2024, **5.3 billion data records** were exposed across 652 publicly disclosed breaches. Cyber attackers constantly exploit this exposed data to plan and execute attacks. And without knowing what's publicly visible, organizations remain vulnerable.

This is where open-source intelligence (OSINT) comes into play. It's the proactive process of scanning your digital presence before someone else does and fixing exposed credentials, unsecured code, or metadata that attackers could exploit.

Understanding what OSINT is forms the foundation, but how exactly is open source intelligence leveraged practically in cybersecurity? Let's explore how OSINT is actively used to detect threats, prevent cyberattacks, and strengthen your organization's defense strategies.

What is Open Source Intelligence?

OSINT is the process of collecting and analyzing publicly available data from sources like websites, forums, code repositories, DNS records, metadata, and social media to generate threat intelligence.

OSINT platforms continuously monitor for signs such as domain mentions or login leaks to detect intrusions, malware activity, and other threats. This helps organizations strengthen their defences, investigate incidents, and receive early warnings of cyber

Vision
To maintain national economic and financial stability along a path of sustainable and inclusive growth.

Mission
To assist in the formulation and ensure the effective execution of sound and equitable economic and financial policies, that put Pakistan on the path of sustained economic development and macro-economic stability with a view to improving the quality of life of the people of Pakistan.

Key Objectives
Achieving allocative efficiency through best budget making Practices Strengthening Public Finance Management Efficient Macro-Economic and Fiscal Management Meaningful coordination with financial institutions Achieving long term debt sustainability Optimizing availability and utilization of foreign exchange Maintaining expenditures control and austerity.
